

Crescentic Osteotomy Blades

NGD offers a selection of saw blades in 3mm increments giving the surgeon more options to choose the optimal cut for the patient's tibia.

- Crescentic osteotomy blades were designed in collaboration with E. B. Okrasinski, DVM, DACVS.
- The variety of blades enables the surgeon to choose the smallest radius possible for a patient's tibia to facilitate the preservation of more bone behind the tibial crest. As a result, the amount of rotation required to get the desired correction may be reduced.
- The saw blades are 50% thinner than conventional blades. NGD blades combine a thinner blade with finer teeth designed to cut bone efficiently and effortlessly.
- Size range includes 10mm, 12mm, 15mm, 18mm, 21mm, 24mm, 27mm, 30mm and 33mm.
- A convenient re-sharpening service includes the use of loaner blades.
